Draft Agency Guidance for licence applicants for IED class 6.1/6.2 Installations, to be read in consultation with BAT Conclusions for Intensive Rearing of Poultry or Pigs

READ ME:

The 'Commission Implementing Decision (EU) 2017/302 of **15 February 2017** establishing best available techniques (BAT) conclusions under Directive 2010/75/EU of the European Parliament and of the Council, for the intensive rearing of Poultry or Pigs' is published and the BAT Conclusions are finalised and address installations for the intensive rearing of poultry and pigs.

To help identify compliance status, for each BAT, in the following table, please state whether it is applicable to your installation and describe how each BAT applies or not to your installation and provide information on your compliance with the requirement.

It may be useful to first identify all the **'Not Applicable'** BATs <u>and provide precise reasons</u> in the **'Applicability Assessment'** box as to <u>why</u> you consider this particular BAT is not applicable at/to your entire installation having regard to the scope/ definitions, general considerations and the information on applicability. (You may need to make reference to relevant processes/activities or individual emission points to provide a comprehensive response).

Please use the **'Scope**' box to describe the relevant activities/processes that come within the scope of this CID.

For each applicable BAT, in the following table, state the status; **'Yes'** or **'Will be'** as appropriate in the **'State whether it is in place or state schedule for implementation'** box. The use of each of these terms is described below.

Information on compliance in the '**Applicability Assessment**' box should include, where applicable, the following:

- (i) Identification of the relevant process/ activity or individual emission points that the BAT requirement applies to at your installation;
- (ii) Where BAT is to use one or a combination of listed techniques, specify the technique(s) implemented/proposed at your installation to achieve the BAT; and
- (iii) A comment on how the requirements are being met or will be met, e.g., a description of the technology/operational controls/management proposed to meet the requirements.

Use of terms:

- (a) **'Yes**' To be entered where the installation is currently compliant with this BAT requirement.
- (b) 'Will be' To be entered where a further technique is required to be installed to achieve compliance with the BAT requirement. In this case you must also specify the date by which the installation will comply with the BAT Conclusion requirement.

BAT Conclusions for Intensive Rearing of Poultry or Pigs (Feb 2017)

The full and complete final BAT Conclusions Document for Intensive Rearing of Poultry or Pigs (Feb 2017) is available at the EIPPC Bureau website: http://eippcb.jrc.ec.europa.eu/reference/

The following guidance in tabular form, must be read in conjunction with the above referenced document.

SCOPE

Identify here the particular processes and activities at the installation that come within the scope of the BAT conclusions for the Intensive Rearing of Poultry or Pigs CID document.

Application of organic fertiliser to land outside the installation boundary will not be controlled by conditions of an IED licence, however the CID document for Intensive Rearing of Poultry or Pigs (2017) includes BAT conclusions on techniques for landspreading of manure.

BAT Conclusions	Applicability Assessment	State whether it is in

(CID should be read (full text) in conjunction with this table)	not it applies, stating	schedule for
	clearly the precise	implementation
	reasons and (2) how the	•
	technique applies or not	
	to your installation)	

Note: This single document addresses both pig installations and poultry installations.

BAT 1-29 below apply to both pig and poultry sites (blank font below)

BAT 30 applies to ammonia emissions from an animal house for pigs (olive green font/shading below)

BAT 31-34 applies to ammonia emissions from <u>poultry</u> houses (red font/shading below)

Section 1 General BAT Conclusions (BAT 1-29 below apply to both pig and poultry sites)	Applicability Assessment ((1)describe whether or not it applies, stating clearly the precise reasons and (2) how the technique applies or not to your installation)	State whether it is in place or state schedule for implementation
BAT 1. BAT is to implement and adhere to an environmental management system (EMS) that incorporates <u>all</u> of the features as detailed in (Section 1.1 Environmental Management System -EMS)	Section 5.1.1 of BREF is applicable.	Will be in place in accordance with conditions of the new license
BAT 2. In order to prevent or reduce the environmental impact and improve overall performance, BAT is to use all the techniques provided. (Section 1.2 Good housekeeping)	A-E of Section 5.1.2 of BREF is applicable	(a) New unit located at the back of the site away from sensitive receptors and all slurry facilities on site have been constructed to prevent contamination of water. (b) All staff are trained on Animal welfare regs, and best practices and all slurry is managed in accordance with 2022 nitrates regulations (c) General EMP on place, site maps in

	Technique (¹)	Applicability
a.	Reduce the crude protein content by using an N-balanced diet based on the energy needs and digestible amino acids.	Generally applicable.
ь	Multiphase feeding with a diet formulation adapted to the specific requirements of the production period.	Generally applicable.
c	Addition of controlled amounts of essential amino acids to a low crude protein diet.	Applicability may be restricted when low- protein feedstuffs are not economically available. Synthetic amino acids are not applicable to organic livestock production.
d	Use of authorised feed additives which reduce the total nitrogen excreted.	Generally applicable.
en	description of the techniques is given in Section 4.10.1. Information on the ission reduction can be taken from recognised European or international Options for ammonia mitigation.	

	Table 1.1 BAT-associated total nitrog	en excreted		
Parameter	Animal category	BAT-associated total nitrogen excreted (¹) (²) (kg N excreted/animal place/year)		
Total nitrogen excreted, expressed as N.	Weaners	1,5-4,0		
	Fattening pigs	7,0-13,0

	•	ment plan, as part of the environmental		survey to be undertaken in
management system (see BAT 1), that includes specified elements (Section 1.7 Noise				accordance with any license
	, , ,	cases where a noise nuisance at sensitive		conditions or Agency
rece	otors is expected and/or has been substa	ntiatea.		instruction.

		(E) Silencers and vibration isolation on pumps, all feeding equipment enclosed where practical, all buildings were insulated to aid in soundproofing and keeping adequate temp for pigs. (F) Surrounding landscape/trees maintained to provide a topographical obstruction to sound waves.
BAT 11. In order to reduce dust emissions from each animal house, BAT is to use one or a combination of the techniques given (Section 1.8 Dust emissions).	Applicable	All animal feed will be delivered to site by lorry in covered containers/trailers. 2. The feed will then be transferred from the lorry to sealed feed bins on site by means of a pipeline; the system prevents dust from escaping. 3. An automated wet feed system will be in operation;

	Technique (¹)	Applicability	the animal feed will be
a	Reduce dust generation inside livestock buildings. For this purpose, a combination of the following techniques may be used:		with water in an enclos wet feed mixing unit lo in the feed and pump h and will then be transp
1.	Use coarser litter material (e.g. long straw or wood shavings rather than chopped straw);	Long straw is not applicable to slurry-based systems.	by pipeline around the u
	Apply fresh litter using a low-dust littering technique (e.g. by hand);	Generally applicable.	pens.
	3. Apply ad libitum feeding;	Generally applicable.	
	Use moist feed, pelleted feed or add oily raw materials or binders in dry feed systems;	Generally applicable.	
	Equip dry feed stores which are filled pneumatically with dust separators;	Generally applicable.	
	Design and operate the ventilation system with low air speed within the house.	Applicability may be limited by animal welfare considerations.	
ь	Reduce dust concentration inside housing by applying one of the following techniques:		
	1. Water fogging;	Applicability may be restricted by the animal sensation of thermal decrease during fogging, in particular at sensitive stages of the animal's life, and/or for cold and humid climates. Applicability may be also restricted for solid manure systems at the end of the rearing period due to high ammonia emissions.	

	2. Oil spraying;	Only applicable to poultry plants with birds older than around 21 days. The applicability to plants for laying hens may be limited due to the risk of con- tamination of the equipment present in the shed.		
	3. Ionisation.	May not be applicable to pig plants or to existing poultry plants due to technical and/or economic reasons.		
С	Treatment of exhaust air by an air cleaning system, such as:			
	1. Water trap;	Only applicable to plants with a tunnel ventilation system.		
	2. Dry filter;	Only applicable to poultry plants with a tunnel ventilation system.		
	3. Water scrubber;	This technique may not be generally applicable due to the high implementation cost.		
	4. Wet acid scrubber;	Applicable to existing plants only where a centralised ventilation system is used.		
	5. Bioscrubber (or biotrickling filter);			
	6. Two-stage or three-stage air cleaning system;			
	7. Biofilter.	Only applicable to slurry-based plants. A sufficient area outside the animal house is needed to accommodate the filter packages. This technique may not be generally applicable due to the high implementation cost. Applicable to existing plants only where a centralised ventilation system is used.		
BAT 1			Costion F 10 of PDFF is applied by	Odour management alors in
AIJ	. Z.		Section 5.19 of BREF is applicable	Odour management plan in place and will be amended in

a far as p spec Note	m, BAT is to set up, implement and regulart of the environmental managemential ified elements (Section 1.9 Odour emissi	ticable, to reduce odour emissions from arly review an odour management plan, ent system (see BAT 1), that includes ons). an odour nuisance at sensitive receptors		accordance with any new license conditions.
BAT 13. In order to prevent or, where that is not practicable, to reduce odour emissions and/or odour impact from a farm, BAT is to use a combination of the techniques given (Section 1.9 Odour emissions). Technique (1) Applicability			A, B, C, E and G applicable of section 5.1.9 of BREF	(a) New houses strategically located on site at furthest point away sensitive receptors.
a	Ensure adequate distances between the farm/plant and the sensitive receptors.	May not be generally applicable to existing farms/plants.		43.44
ь	Use a housing system which implements one or a combination of the following principles: — keeping the animals and the surfaces dry and clean (e.g. avoid feed spillages, avoid dung in lying areas of partly slatted floors); — reducing the emitting surface of manure (e.g. use metal or plastic slats, channels with a reduced exposed manure surface); — removing manure frequently to an external (covered) manure store; — reducing the temperature of the manure (e.g. by slurry cooling) and of the indoor environment; — decreasing the air flow and velocity over the manure surface; — keeping the litter dry and under aerobic conditions in litter-based systems.	Decreasing the temperature of the indoor environment, the air flow and the velocity may not be applicable due to animal welfare considerations. Slurry removal by flushing is not applicable to pig farms located close to sensitive receptors due to odour peaks. See applicability for animal housing in BAT 30, BAT 31, BAT 32, BAT 33 and BAT 34.		(b) All animals are house in dry housing on fully slatted floors. Frequent slurry removal from shallow tanks to external covered storage (Currently being covered) Temp of slurry cooled by slurry cooling system.
	·			houses is via stacks through ridge of roof

			and all fans operated
С	Optimise the discharge conditions of exhaust air from the animal house by using one or a combina-	Alignment of the ridge axis is not applicable to existing plants.	via a variable speed
	tion of the following techniques:		drive.
	- increasing the outlet height (e.g. exhaust air		(e) External slurry store will
	above roof level, stacks, divert air exhaust		be covered (Currently being
	through the ridge instead of through the low part of the walls);		covered) – Aeration is carried
	- increasing the vertical outlet ventilation vel-		out in the external storage
	ocity;		tank.
	 effective placement of external barriers to cre- ate turbulence in the outgoing air flow (e.g. 		(g) All slurry operations are
	vegetation);		
	- adding deflector covers in exhaust apertures		carried out in accordance
	located in low parts of walls in order to divert exhaust air towards the ground;		with nitrates directive SI 113 OF 2022
	 dispersing the exhaust air at the housing side which faces away from the sensitive receptor; 		
	 aligning the ridge axis of a naturally ventilated building transversally to the prevailing wind direction. 		

d	Use an air cleaning system, such as: 1. Bioscrubber (or biotrickling filter); 2. Biofilter; 3. Two-stage or three-stage air cleaning system.	This technique may not be generally applicable due to the high implementation cost. Applicable to existing plants only where a centralised ventilation system is used. A biofilter is only applicable to slurry-based plants. For a biofilter, a sufficient area outside the animal house is needed to accommodate the filter packages.	
e	Use one or a combination of the following techniques for storage of manure:		
	Cover slurry or solid manure during storage;	See applicability of BAT 16.b for slurry. See applicability of BAT 14.b for solid manure.	
	Locate the store taking into account the general wind direction and/or adopt measures to reduce wind speed around and above the store (e.g. trees, natural barriers);		
	3. Minimise stirring of slurry.	Generally applicable.	

f	Process manure with one of the following techniques in order to minimise odour emissions during (or prior to) landspreading:		
	Aerobic digestion (aeration) of slurry;	See applicability of BAT 19.d.	
	2. Compost solid manure;	See applicability of BAT 19.f.	
	3. Anaerobic digestion.	See applicability of BAT 19.b.	
g	Use one or a combination of the following techniques for manure landspreading:		
	Band spreader, shallow injector or deep injector for slurry landspreading;	See applicability of BAT 21.b, BAT 21.c or BAT 21.d.	
	Incorporate manure as soon as possible.	See applicability of BAT 22.	

is to	der to reduce ammonia emissions to ai	r from the storage of solid manure, BAT ques given (Section 1.10 Emissions from	Not Applicable as no solid manure stored at this facility.	
	Technique (¹)	Applicability		
a	Reduce the ratio between the emitting surface area and the volume of the solid manure heap.	Generally applicable.		
ь	Cover solid manure heaps.	Generally applicable when solid manure is dried or pre-dried in animal housing. May not be applicable to not dried solid manure in case of frequent addition to the heap.		
с	Store dried solid manure in a barn.	Generally applicable.		
BAT			Not Applicable as no solid	
wate	•	cticable, to reduce emissions to soil and BAT is to use <u>a combination of</u> the m solid manure storage).	manure stored at this facility.	

	Technique (¹)	Applicability		
a	Store dried solid manure in a barn.	Generally applicable		
ь	Use a concrete silo for storage of solid manure.	Generally applicable.		
с	Store solid manure on solid impermeable floor equipped with a drainage system and a collection tank for the run-off.	Generally applicable.		
d	Select a storage facility with a sufficient capacity to hold the solid manure during periods in which landspreading is not possible.	Generally applicable.		
e	Store solid manure in field heaps placed away from surface and/or underground watercourses which liquid run-off might enter.	Only applicable to temporary field heaps which change location each year.		
BAT :	16.		A & B of section 5.1.11 of BREF is	(a) Shallow tanks have been

coml	pination of the techniques given. (Secti	on 1.11 Emissions from slurry storage).		with frequent removal to
	Technique (¹)	Applicability		external covered store.
a	Appropriate design and management of the slurry store by using a combination of the following techniques:			(B) External slurry store will be covered. Frequent slurry removal to nearby Anaerobic
				digestion is in operation from this site.

	Reduce the ratio between the emitting surface area and the volume of the slurry store;	May not be generally applicable to existing stores. Excessively high slurry stores may not be applicable due to increased costs and safety risks.
	Reduce wind velocity and air exchange on the slurry surface by operating the store at a lower level of fill;	May not be generally applicable to existing stores.
	Minimise stirring of slurry.	Generally applicable.
ь	Cover the slurry store. For this purpose, one of the following techniques may be used:	
	1. Rigid cover;	May not be applicable to existing plants due to economic considerations and structural limitations to withstand the extra load.
	2. Flexible covers;	Flexible covers are not applicable to areas where prevailing weather conditions can compromise their structure.

	3. Floating covers such as: — plastic pellets; — light bulk materials; — floating flexible covers; — geometrical plastic tiles; — air-inflated cover; — natural crust; — straw.	The use of plastic pellets, light bulk materials and geometrical plastic tiles is not applicable to naturally crusting slurries. Agitation of the slurry during stirring, filling and emptying may preclude the use of some floating materials which may cause sedimentation or blockages in the pumps. Natural crust formation may not be applicable to cold climates and/or to slurry with low dry matter content. Natural crust is not applicable to stores where stirring, filling and/or discharging of slurry renders the natural crust unstable.		
с	Slurry acidification.	Generally applicable.		
DAT	17		Not Appliable as as south	
	BAT 17.		Not Applicable as no earth	
		to air from an earth-banked slurry store	banked lagoon on site.	
		the techniques given (Section 1.11 Emissions		
from	slurry storage).			

	Technique (¹)	Applicability		
a.	Minimise stirring of the slurry.	Generally applicable.		
b	Cover the earth-banked slurry store (lagoon) with a flexible and/or floating cover such as: — flexible plastic sheets; — light bulk materials; — natural crust; — straw.	Plastic sheets may not be applicable to large existing lagoons due to structural reasons. Straw and light bulk materials may not be applicable to large lagoons where wind drift does not permit the lagoon surface to be kept fully covered. The use of light bulk materials is not applicable to naturally crusting slurries. Agitation of the slurry during stirring, filling and emptying may preclude the use of some floating materials which may cause sedimentation or blockages in the pumps. Natural crust formation may not be applicable to cold climates and/or to slurry with low dry matter content. Natural crust is not applicable to lagoons where stirring, filling and/or discharging of slurry renders the natural crust unstable.		
BAT 18. In order to prevent emissions to soil and water from slurry collection, piping, and from a store and/or an earth-banked storage (lagoon), BAT is to use a combination of the techniques given (Section 1.11 Emissions from slurry storage).		A, B, C, E and F of section 5.1.11 of BREF is Applicable and D is not applicable.	(A) All infrastructure on site was installed in accordance with manufacture spec. (B) A nearby Anaerobic Digester takes in Slurry during the closed period. 90% of slurry generated on both the old and new unit is frequently removed to AD facility. The new unit operates shallow tanks with all slurry flowing to an	

	Technique (¹)	Applicability		exterior covered/sealed
a	Use stores that are able to withstand mechanical, chemical and thermal influences.	Generally applicable.		storage tank. (Yet to be covered)
ь	Select a storage facility with a sufficient capacity to hold the slurry during periods in which land- spreading is not possible.	Generally applicable.		(C) All sumps, channels, pits tanks etc are constructed with mass concrete
С	Construct leak-proof facilities and equipment for collection and transfer of slurry (e.g. pits, channels, drains, pump stations).	Generally applicable.		(D) No earth banked lagoon on site (E) There is leak detection points at the end of each
d	Store slurry in earth-banked stores (lagoons) with an impermeable base and walls e.g. with clay or plastic lining (or double-lined).	Generally applicable to lagoons.		building
e	Install a leakage detection system, e.g. consisting of a geomembrane, a drainage layer and a drainage pipe system.	Only applicable to new plants.		
f	Check structural integrity of stores at least once every year.	Generally applicable.		
BAT 1	9.		Not applicable as no on farm	
If on-f	farm processing of manure is used, in order to		processing is undertaken at this	
phosp	phorus, odour and microbial pathogens to air a	and water and facilitate manure	site.	

		g, BAT is to process the manure by applying one or a s (Section 1.12 On Farm processing of manure)
	Technique (1)	Applicability
a	Mechanical separation of slurry. This includes e.g.: Screw press separator; — Decanter-centrifuge separator; — Coagulation-Flocculation; — Separation by sieves; — Filter pressing.	 Only applicable when: a reduction of nitrogen and phosphorus content is needed due to limited available land for manure application; manure cannot be transported for landspreading at a reasonable cost. The use of polyacrylamide as a flocculant may not be applicable due to the risk of acrylamide formation.
b	Anaerobic digestion of manure in a biogas installation.	This technique may not be generally applicable due to the high implementation cost.
С	Use of an external tunnel for manure drying.	Only applicable to manure from plants for laying hens. Not applicable to existing plants without manure belts.
d	Aerobic digestion (aeration) of slurry.	Only applicable when pathogen and odour reduction is important prior to landspreading. In cold climates, it may be difficult to maintain the required level of aeration during winter.
e	Nitrification-denitrification of slurry.	Not applicable to new plants/farms. Only applicable to existing plants/farms when the removal of nitrogen is necessary due to limited available land for manure application.
f	Composting of solid manure.	Only applicable when: — manure cannot be transported for landspreading at a reasonable cost; — pathogen and odour reduction is important prior to landspreading; — there is enough space in the farm for windrows to be established.

phos	der to prevent or, where that is not practicable, to reduce emissions of nitrogen, phorus and microbial pathogens to soil and water from manure landspreading, s to use all the techniques given (Section 1.13 Manure landspreading).	Section 5.1.13 of BREF is not applicable as no land spreading occurs on site.	
	Technique		
a	Assess the manure receiving land to identify risks of run-off, taking into account: — soil type, conditions and slope of the field; — climatic conditions; — field drainage and irrigation; — crop rotations; — water resources and water protected zones.		
ь	Keep sufficient distance between manure spreading fields (leaving an untreated strip of land) and: 1. areas where there is a risk of run-off to water such as watercourses, springs, boreholes, etc.; 2. neighbouring properties (including hedges).		
С	Avoid manure spreading when the risk of run-off can be significant. In particular, manure is not applied when: 1. the field is flooded, frozen or snow-covered; 2. soil conditions (e.g. water saturation or compaction) in combination with the slope of the field and/ or field drainage are such that the risk of run-off or drainage is high; 3. run-off can be anticipated according to expected rainfall events.		
d	Adapt the manure landspreading rate taking into account the nitrogen and phosphorus content of the manure and taking into account the characteristics of the soil (e.g. nutrient content), the seasonal crop requirements and weather or field conditions that could cause run-off.		
e	Synchronize manure landspreading with the nutrient demand of crops.		

f	Check the spreading fields at regular intervals to ide necessary.	entify any sign of run-off and properly respond when		
g	Ensure adequate access to the manure store and the spillage.	at loading of manure can be done effectively without		
h	Check that machinery for manure landspreading is tion rate.	in good working order and set at the proper applica-		
		from slurry landspreading, BAT is to use in (Section 1.13 Manure landspreading).	Section 5.1.13 of BREF is not applicable as no land spreading occurs on site.	
	Technique (¹)	Applicability		
a	Slurry dilution, followed by techniques such as low-pressure water irrigation system.	Not applicable to crops grown to be eaten raw due to the risk of contamination. Not applicable when the soil type does not allow rapid infiltration of dilute slurry into the soil. Not applicable when crops do not require irrigation. Applicable to fields easily connected to the farm by pipework.		
ь	Band spreader, by applying one of the following techniques: 1. Trailing hose; 2. Trailing shoe.	Applicability may be limited when the straw content of the slurry is too high or when the dry matter content of the slurry is higher than 10 %. Trailing shoe is not applicable to growing solid-seeded arable crops.		

С	Shallow injector (open slot).	where it is dition.	e on stony, shallow or compacted soil fficult to achieve a uniform penetramay be limited where crops may be nachinery.

use	rder to reduce ammonia em		om each pig house, BAT is to (Section 2.1 Ammonia emissions	Section 5.2.1 of BREF is applicable	(A) iii - Shallow tanks in place with frequent slurry removal to external covered storage.(B) Slurry cooling system in place.
	Technique (1)	Animal category	Applicability		
a	One of the following techniques, which apply one or a combination of the following principles: (i) reduce the ammonia emitting surface; (ii) increase the frequency of slurry (manure) removal to external storage; (iii) separate urine from faeces; (iv) keep litter clean and dry O. A deep pit (in case of a fully or partly slatted floor) only if used in combination with an additional mitigation measure, e.g.: — a combination of nutritional management techniques; — air cleaning system; — pH reduction of the slurry; — slurry cooling.	All pigs	Not applicable to new plants, unless a deep pit is combined with an air cleaning system, slurry cooling and/or pH reduction of the slurry.		

Technique (¹)	Animal category	Applicability
A vacuum system for frequent slurry removal (in case of a fully or partly slatted floor).	All pigs	May not be generally applicable to existing plants due to technical and/or economic considerations.
Slanted walls in the manure channel (in case of a fully or partly slatted floor).	All pigs	
A scraper for frequent slurry removal (in case of a fully or partly slatted floor).	All pigs	
Frequent slurry removal by flushing (in case of a fully or partly slatted floor).	All pigs	May not be generally applicable to existing plants due to technical and/or economic considerations.
		When the liquid fraction of the slurry is used for flushing, this technique may not be applicable to farms located close to sensitive receptors due to odour peaks during flushing.
5. Reduced manure pit (in case of a partly slatted floor).	Mating and gestating sows	May not be generally applicable to existing plants due to technical and/or economic considerations.
	Fattening pigs	

Full litter system (in case of a solid concrete floor). Kennel/hut housing (in case of a partly slatted floor).	Weaners Fattening pigs	Solid manure systems are not applicable to new plants unless it can be justified for animal welfare reasons. May not be applicable to naturally ventilated plants located in warm climates and to existing plants with forced ventilation for weaners and fattening pigs. BAT 30.a7 may require large space availability.	
	Fattening pigs		
Straw flow system (in case of a solid concrete floor).	Weaners		
	Fattening pigs		
9. Convex floor and separated man- ure and water channels (in case of	Weaners	May not be generally applicable to existing plants due to technical and/or	
partly slatted pens).	Fattening pigs	economic considerations.	

Technique (¹)	Animal category	Applicability
10. Littered pens with combined manure generation (slurry and solid manure).	Farrowing sows	
11. Feeding/lying boxes on solid floor (in case of litter-based pens).	Mating and gestating sows	Not applicable to existing plants without solid concrete floors.
12. Manure pan (in case of a fully or partly slatted floor).	Farrowing sows	Generally applicable.
13. Manure collection in water.	Weaners	May not be generally applicable to existing plants due to technical and/or economic considerations.
	Fattening pigs	constitutions.
14. V-shaped manure belts (in case of partly slatted floor).	Fattening pigs	
15. A combination of water and man- ure channels (in case of a fully slatted floor).	Farrowing sows	

		I		
	16. Littered external alley (in case of a solid concrete floor).	Fattening pigs	Not applicable to cold climates. May not be generally applicable to existing plants due to technical and/or economic considerations.	
ь	Slurry cooling.	All pigs	Not applicable when: — heat reuse is not possible; — litter is used.	
с	Use of an air cleaning system, such as: 1. Wet acid scrubber; 2. Two-stage or three-stage air cleaning system; 3. Bioscrubber (or biotrickling filter).	All pigs	May not be generally applicable due to the high implementation cost. Applicable to existing plants only where a centralised ventilation system is used.	
d	Slurry acidification.	All pigs	Generally applicable.	
e	Use of floating balls in the manure channel.	Fattening pigs	Not applicable to plants equipped with pits that have slanted walls and to plants that apply slurry removal by flushing.	
(1) A d	escription of the techniques is given in Section	ns 4.11 and 4.12.		
See a	lso Table 2.1 of CID			

Table 2.1
BAT-AEL for ammonia emissions to air from each pig house

Parameter	Animal category	BAT-AEL (¹) (kg NH ₃ /animal place/year)	
Ammonia expressed as NH ₃	Mating and gestating sows	0,2-2,7 (2) (3)	
	Farrowing sows (including piglets) in crates	0,4-5,6 (4)	
	Weaners	0,03-0,53 (5) (6)	
	Fattening pigs	0,1-2,6 (7) (8)	

- (1) The lower end of the range is associated with the use of an air cleaning system.
- (2) For existing plants using a deep pit in combination with nutritional management techniques, the upper end of the BAT-AEL is 4,0 kg NH₃/animal place/year.
- (3) For plants using BAT 30.a6, 30.a7 or 30.a11, the upper end of the BAT-AEL is 5,2 kg NH₃/animal place/year.
- (4) For existing plants using BAT 30.a0 in combination with nutritional management techniques, the upper end of the BAT-AEL is 7,5 kg NH√animal place/year.
- (5) For existing plants using a deep pit in combination with nutritional management techniques, the upper end of the BAT-AEL is 0,7 kg NH₃/animal place/year.
- (6) For plants using BAT 30.a6, 30.a7 or 30.a8, the upper end of the BAT-AEL is 0,7 kg NH_3 /animal place/year.
- (7) For existing plants using a deep pit in combination with nutritional management techniques, the upper end of the BAT-AEL is 3,6 kg NH√animal place/year.
- (8) For plants using BAT 30.a6, 30.a7, 30.a8 or 30.a16, the upper end of the BAT-AEL is 5,65 kg NH√animal place/year.

The BAT-AELs may not be applicable to organic livestock production. The associated monitoring is in BAT 25.

BAT	tion 3. BAT Conclusions for Inter 31-34 applies to ammonia emissions from ion 3.1 Ammonia emissions from poultry	n poultry houses	
In ordanic breed (Sect	BAT 31. In order to reduce ammonia emissions to air from each house for laying hens, broiler breeders or pullets, BAT is to use one or a combination of the techniques given (Section 3.1.1 Ammonia emissions from houses for laying hens, broiler breeders or pullets).		
	Technique (¹)	Applicability	
a	Manure removal by belts (in case of enriched or unenriched cage systems) with at least: — one removal per week with air drying; or — two removals per week without air drying.	Enriched cage systems are not applicable to pullets and broiler breeders. Unenriched cage systems are not applicable to laying hens.	
ь	In case of non-cage systems:		
	O. Forced ventilation system and infrequent manure removal (in case of deep litter with a manure pit) only if used in combination with an additional mitigation measure, e.g.: — achieving a high dry matter content of the manure; — an air cleaning system.	with an air cleaning system.	

	Technique (¹)	Applicability
	Manure belt or scraper (in case of deep litter with a manure pit).	Applicability to existing plants may be limited by the requirement for a complete revision of the housing system.
	Forced air drying of manure via tubes (in case of deep litter with a manure pit)	The technique can be applied only to plants with sufficient space underneath the slats.
	3. Forced air drying of manure using perforated floor (in case of deep litter with a manure pit).	Due to high implementation costs, applicability to existing plants may be limited.
	4. Manure belts (in case of aviary).	Applicability to existing plants depends on the width of the shed.
	5. Forced drying of litter using indoor air (in case of solid floor with deep litter).	Generally applicable.
c	Use of an air cleaning system, such as: 1. Wet acid scrubber; 2. Two-stage or three-stage air cleaning system; 3. Bioscrubber (or biotrickling filter).	May not be generally applicable due to the high implementation cost. Applicable to existing plants only where a centralised ventilation system is used.
See a	lso Table 3.1 of CID	

	Table 3.	
BAT-AELs for ammonia emissions to air from each house for laying hens		
Parameter	Type of housing	BAT-AEL (kg NH ₃ /animal place/year)
Ammonia expressed as NH,	Cage system	0,02-0,08
	Non-cage system	0,02-0,13 (¹)
The associated monitoring	g is in BAT 25. The BAT-AEL may	not be applicable to organic livestock production.
n order to reduce a	combination of the tech	r from each house for <u>broilers</u> , BAT is iniques given (Section 3.1.2 Ammonia
	Technique (¹)	Applicability
a Forced ventilation		**

Ъ	Forced drying system of litter using indoor air (in case of solid floor with deep litter).	For existing plants, the applicability of forced air drying systems depends on the height of the ceiling. Forced air drying systems may not be applicable to warm climates, depending on the indoor temperature.	
с	Natural ventilation, equipped with a non-leaking drinking system (in case of solid floor with deep litter).	Natural ventilation is not applicable to plants with a centralised ventilation system. Natural ventilation may not be applicable during the initial stage of rearing of broilers and due to extreme climate conditions.	
d	Litter on manure belt and forced air drying (in case of tiered floor systems).	For existing plants, the applicability depends on the height of the side walls.	
e	Heated and cooled littered floor (in case of combideck systems).	For existing plants, the applicability depends on the possibility to install closed underground storage for the circulating water.	
f	Use of an air cleaning system, such as: 1. Wet acid scrubber; 2. Two-stage or three-stage air cleaning system; 3. Bioscrubber (or biotrickling filter).	May not be generally applicable due to the high implementation cost. Applicable to existing plants only where a centralised ventilation system is used.
